

Agri-Vehicle Rental App

MVP Scope & Application Workflow

1. Executive Summary

The proposed product is a social-impact mobile application that connects people who need agricultural vehicles with verified local vehicle owners and/or drivers. The initial launch will focus on Tier 2 cities.

- Mobile application: Flutter.
- Backend/API: Python.
- Single mobile app with two login experiences: User and Provider.
- MVP focus: vehicle/provider discovery, provider listings, verification, contact, and privacy-protected calling.
- Target: a usable first MVP.
- Future modules such as jobs, classifieds, and real estate are not part of the MVP; they are documented only to clarify the product roadmap.

2. Business Problem & Proposed Solution

2.1 Problem

- Agricultural vehicle rentals can be difficult to discover in smaller and Tier 2 markets.
- Large commercial platforms may have limited incentive to serve fragmented local demand.
- Renters may not know which local vehicle owners or drivers are genuine and available.
- Directly exposing personal phone numbers can create privacy and misuse concerns.

2.2 Proposed Solution

- Provide a single mobile app where renters can search for nearby providers.
- Allow vehicle owners/drivers to create provider profiles and vehicle listings.
- Use provider document/photo verification to improve trust.
- Allow users to contact providers without exposing personal phone numbers.
- Use location/radius-based discovery so users can find relevant local providers.

3. Confirmed MVP Scope

The following is the recommended scope to confirm with the client for the initial release.

Area	MVP Requirement	Expected Outcome
Authentication	User and Provider login/register flows	Each role enters the correct application experience.
User Profile	Basic renter profile	User can maintain the minimum information needed for enquiries.
Provider Profile	Provider/owner/driver profile	Provider can present identity/contact/service information.
Vehicle Listing	Add vehicle details, photos and rental/service information	Vehicle becomes searchable after required verification/approval.
Provider Verification	Upload required photos/documents such as RC book	Admin/manual verification can approve or reject provider/listing.
Location Search	Find providers within a configurable radius	User sees relevant nearby providers.
Listing Details	View vehicle/provider information	User can understand the offering before contacting.
Contact	In-app/app-routed calling	User can call provider without directly exposing phone numbers.
Basic Status	Verification/listing availability status	Only eligible/approved providers are discoverable.
Basic Admin Support	Manual provider registration/verification support	Admin can onboard providers where digital literacy is low.

4. User Roles

Role	Primary Responsibility	MVP Capabilities
User / Renter	Find and contact agricultural vehicle providers	Register/login, set basic profile, search nearby, view listing, initiate call.
Provider / Owner / Driver	Offer vehicles/services to renters	Register/login, submit profile, add vehicle, upload documents/photos, manage listing status.
Admin	Trust, onboarding and operational control	Manually onboard providers, review documents, approve/reject provider/listing, support operations.

5. Proposed Application Flow

5.1 Entry & Authentication Flow

1. User opens the mobile app.
2. User selects the required login/registration type: User or Provider.

3. User completes authentication.
4. Application identifies the role and redirects to the relevant home/dashboard.
5. If required profile information is missing, the application prompts the user to complete it.

5.2 User / Renter Flow

6. User logs in.
7. User grants location permission or selects a location manually.
8. Application loads nearby verified vehicle/provider listings using the configured search radius.
9. User can review the available provider/vehicle cards.
10. User opens a listing to view vehicle details, provider information, photos, and availability/service information captured in the MVP.
11. User chooses the contact/call action.
12. The call is routed through the application/calling service so the provider's personal number is not directly exposed.
13. User can return to search and contact another provider.

5.3 Provider / Owner / Driver Flow

14. Provider registers/logs in.
15. Provider completes the basic provider profile.
16. Provider enters vehicle details and uploads required photos/documents.
17. Provider submits the information for verification.
18. Admin reviews the submitted provider information and documents.
19. If approved, the provider/listing becomes eligible for discovery.
20. Provider can manage the listing information within the agreed MVP capabilities.
21. If rejected, the provider receives an appropriate status/message and can correct and resubmit information, if included in the final approved flow.

5.4 Admin / Verification Flow

22. Admin receives or views pending provider registrations.
23. Admin checks provider details and submitted documents/photos.
24. Admin approves or rejects the provider/listing.
25. Approved providers become visible to users based on location/radius and listing status.
26. Rejected or incomplete providers remain unavailable until corrected and approved.

6. End-to-End App Flow

Simple flow

APP OPEN → ROLE SELECTION → LOGIN/REGISTER → PROFILE → USER SEARCH / PROVIDER LISTING → LOCATION/RADIUS FILTER → LISTING DETAILS → CONTACT/CALL → COMPLETION

Stage	User Side	Provider Side	System/Admin
1. Entry	Open app	Open app	—
2. Authentication	User login/register	Provider login/register	Authentication & role handling
3. Profile	Complete basic profile	Complete provider profile	Validate required fields
4. Listing	Search for vehicles	Create vehicle listing	Store listing
5. Verification	See approved listings	Upload RC/documents/photos	Review and approve/reject
6. Discovery	Search by nearby radius	Listing appears when eligible	Apply listing/verification status
7. Details	View provider/vehicle	Maintain listing details	Provide stored data
8. Contact	Start protected call	Receive call	Route/mask call as designed

7. MVP Exclusions / Not Included Unless Specifically Confirmed

- Full-scale job marketplace.
- Classifieds marketplace.
- Real-estate marketplace.
- Advanced ratings/reviews and dispute management unless specifically required for MVP.
- Advanced analytics/reporting dashboards.
- Large-scale multi-city/district operations beyond the initial pilot.
- Complex provider fleet management or enterprise features.
- Any third-party integration not required for the core MVP flow.

8. Future Scope – For Roadmap Clarification Only

The following modules were discussed as possible future expansion areas. They are documented here so the client can see the intended direction of the platform. They are not part of the MVP unless separately approved.

Future Module	Possible Purpose	Relationship to MVP
Jobs	Connect people with local employment/service opportunities.	Future marketplace module.
Classifieds	Allow users/providers to post and discover local goods/services.	Future marketplace module.
Real Estate	Listings for property discovery and related enquiries.	Future marketplace module.
Tier 1 Expansion	Expand the successful model into larger cities.	Post-MVP geographic expansion.
District-wide Expansion	Broaden provider/user coverage across districts.	Post-MVP scale-up.
Advanced Booking	Date/time booking, availability, confirmations and cancellations.	Possible later rental workflow.
Payments	Online payment, commission, refunds and settlement.	Possible later monetization layer.
Ratings & Reviews	Build provider trust through user feedback.	Possible later trust feature.

Future Module	Possible Purpose	Relationship to MVP
Notifications	Push/SMS/WhatsApp/email notifications for operational events.	Can be added as product maturity increases.
Advanced Admin & Analytics	Dashboards, operational metrics, reports and moderation tools.	Post-MVP operations and scale.
